

Water: an universal amplifier for the signals of life

Livio Giuliani

My talk will report our recent experiments (mine and of my colleagues in Rome) in hypo-magnetic room and the evidence that ICR, tuned with the specific ratio q/m of hydronium, turns PH and increases conductivity in water, and then water is working as an amplifier or an antenna, able to be tuned with every frequency (at least in ELF band).

Some of these results are reported in a paper (with AR Liboff, E. D'Emilia, S. Grimaldi, A.Lisi e M. Ledda) that we recently submitted to EBM.

The consequences concern a wide set of relationships between phenomena: from the role of Schumann's frequencies in life up to the amplification, by means of water, of DNA signals in living cells. And the experimental results again are a confirmation of the existence of coherent domains in water.
